

An introduction to Genomic Medicine in Pancreatic Cancer

Philandra Costello
Lead Genomics Nurse
Central & South Genomic Medicine Service

- When you hear the word **GENOMICS**, what comes to mind?

Learning Outcomes

Genomic Medicine: From Specialist Testing to Everyday care

The changing role of genomics

Past

- Mainly specialist services
- Rare inherited conditions
- Limited genetic testing

Today

- NHS Genomic Medicine Service
- Testing embedded into cancer pathways
- Tumour profiling and inherited risk

Future

- Earlier detection
- Prevention and prediction
- More personalised care

Harnessing genomics, data and innovation to transform care
[10 Year Health Plan for England: fit for the future - GOV.UK](https://www.gov.uk/government/publications/10-year-health-plan-for-england)

England

- Coordinating and deliver genomic testing
- Embedding genomics
- Improving equitable access to genomic testing
- Enabling precision medicine
- Adverse Drug Reactions (ADR)
- Data and Digital
- Research and Innovation

7 Regional Genomic Medicine Services

Where it applies

Genomics Test Directory

- The primary source for all commissioned genomic tests in NHS England is the [National Genomic Test Directory](#). This exists in two parts:
 - **Cancer Test Directory**
 - **Rare & Inherited Disease Directory** – for (germline) tests

UK

What is Genomics?

Genomics

- The study of an organism's complete set of genetic information.
- The genome includes both genes (coding) and non-coding DNA.
- 'Genome': the complete genetic information of an organism.

VS

Genetics

- The study of heredity
- The study of the function and composition of single genes.
- 'Gene': specific sequence of DNA that codes for a functional molecule.

What is Genomics?

Our DNA is like a library of instructions for life

HOW GENOMIC INFORMATION IS USED IN CANCER CARE

All cancer is genomic, but not all cancer is inherited

Genomic testing in pancreatic cancer: different questions, different tests

Meet David: Where does genomics Fit?

 David, 58

Diagnosed with advanced pancreatic cancer

Questions:

- What is driving my cancer?
- Could genomics affect my treatment?
- What does this mean for my family?

David's genomic results

David's tumour testing identifies a *KRAS* variant.

Does this mean his children have inherited an increased cancer risk?

A. Yes

B. No

C. Unsure

KRAS: Understanding the tumour

KRAS = growth switch

Normal:

ON ↔ OFF

KRAS variant:

Stuck ON

Tumour change

Future:

KRAS-targeted therapies
Clinical trials

Inherited genomic findings: treatment and family implications

Examples:

- *BRCA1 / BRCA2*
- *PALB2*
- *ATM*

May influence:

- Platinum-based chemotherapy
- Targeted treatments in some patients
- Clinical trials
- Family risk assessment

Inherited pancreatic cancer risk

Around **5–10%** of pancreatic cancers are linked to an inherited genetic variant

HEREDITARY CANCER

Caused by a **specific gene variant** passed through a family.
Present from birth and may increase the chance of certain cancers.

Identifying the variant can help not only the patient, but also relatives.

Examples of genes associated with inherited pancreatic cancer risk:

Two important concepts:
Hereditary vs **Familial** cancer

FAMILIAL CANCER

More cancers seen in a family, but no single inherited gene variant is identified.

May be due to a combination of:

Shared genetic factors

Environmental factors

Lifestyle factors

Chance

Important!

• Family History

- Cancer at a young age
- Multiple Relatives affected
- Linked cancers e.g. Pancreatic cancer, melanoma, breast, ovarian, bowel or endometrial cancers in the family
- Known cancer genetic diagnosis

Inherited genomic findings: what happens next?

<https://bsgm.org.uk/healthcare-professionals/list-of-genetic-clinics/>

Why might genomic testing be done before giving some medicines?

- A. To predict every side effect
- B. To understand how someone may process or respond to a medicine
- C. To diagnose cancer
- D. To replace clinical judgement

Genomics and Personalised Medicine – Treatment and Safety

Pharmacogenomics — the patient

DPYD

- Fluoropyrimidine chemotherapy
- Reducing risk of severe toxicity

Tumour biomarkers – Understanding the Cancer

BRCA1/BRCA2

- DNA repair pathway

MSI-high/MMR deficiency

- Immunotherapy approaches

KRAS

- Emerging targeted therapies / trials

NTRK/HER2

- Targeted therapies

The future: Liquid Biopsy and Circulating Tumour DNA (ctDNA)

- Tumour Information
 - Helps understand what is driving the cancer
- Monitoring
 - Treatment response and recurrence research
- Precision Medicine
 - Supporting future personalised care and clinical trials

Benefits, Challenges and Limitations of Genomic Medicine

Opportunities

- Understand the cancer
- Personalised treatment
- Safer medicines
- Family prevention
- Research & Innovation

Challenges & Limitations

- Uncertain results
- Equal access for all
- Supporting conversations
- Data Security & Trust
- Science still evolving

When should we think about genomics?

- At diagnosis – could genomic testing guide care?
- When considering treatment options – Targeted Treatments/Clinical Trials
- When tumour results identify important biomarkers e.g. *BRCA*, *KRAS*, *MSI High*, *PALB2* - Understanding what is driving the cancer
- When family history suggests inherited risk
 - Younger age at diagnosis
 - Multiple relatives with pancreatic, breast, ovarian, prostate or bowel cancer
 - Known familial cancer gene variant
- When results may have implications for relatives

Your role

- Recognise: When genomics might be relevant

- Explain : Basic concepts in plain language

- Support: Patients and Families

- Signpost: Specialist services and Resources

Final take-home messages

- All cancer is genomic, but not all cancer is inherited
- Genomics can influence treatment and make care safer
- Family History Matters: take it and act on it
- Pharmacogenomics supports safer prescribing
- You do not need to be the expert – Recognise, Support and Signpost

[Genomic Medicine Service](#)

Genomics Learning Passport for Nurses

- Self-directed tool
- Three levels: baseline essentials, intermediate and specialist.
- Learn at your own pace,
- Directs to trusted resources.

<https://www.genomicseducation.hee.nhs.uk/documents/genomics-learning-passport-for-nurses/>

Genomics for Cancer Nurses Passport

Available Soon!

- Mapped against specific NMC Code/Standards of Proficiency and ACCEND Framework
- Supports re-validation
